CARPET TILE MAINTENANCE //

Sensible precautions and educated planning are important for perfect maintenance. Appropriate selection of colours along with Effective entry mats to remove dirt, are of major importance for keeping carpet in good condition.

A carefully-planned and executed cleaning program must focus on critical areas such as transit areas between hard floors and broadloom carpet, corridors and high traffic areas.

Daily vacuum-cleaning and regular stain removal are the first steps.

Another aspect of a well planned cleaning programme is the treatment with a dry powder system. This should be followed by periodical vacuum cleaning of the total surface.

For complete renovation, once per year, the carpet should be cleaned with a spray-extraction machine, making sure however that the carpet is thoroughly rinsed, in order to remove detergent residues (if any) which could cause resoiling.

Therefore: A customized comprehensive carpet care programme consists of five elements:

Soil Containment – isolation of soil entering the building using mats at entrances

Vacuuming – scheduled frequency for removal of dry soil using a suitable brush vacuum cleaner

Spot and Spill Removal System – using professional spot removal techniques

Interim Cleaning – scheduled frequency appearance cleaning for all traffic areas.

Restorative Cleaning – scheduled frequency deep cleaning to remove residues and trapped soils.
